Product Design

Case: Coffee & Code - Instant Meetup Finder

May 2026

1. Vision & Scope

Vision Statement:

For solo tech workers, remote employees, and students who want spontaneous offline meetups around shared interests, Coffee & Code is a mobile app that lets them find and join nearby coffee shop meetups in under 15 minutes. Unlike Meetup.com or LinkedIn, our product requires zero planning -- just pick a topic, set "right now", and get matched instantly.

Scope:

IN scope:

- User registration (Google/GitHub auth)
- Setting up a profile with interests (topics, tech stack, languages)
- Creating a spontaneous meetup: topic, radius, time window
- Matching algorithm: topic + location + availability
- In-app chat for coordination
- Check-in / rating system
- Push notifications

OUT of scope (v1):

- Payments or subscription
- Food/drink ordering integration
- Video calls (app is for offline only)
- Enterprise features (team accounts, reporting)

2. Stakeholders

Power/Interest Matrix:

Stakeholder	Power	Interest	Strategy
End users (tech workers)	Low	High	Keep informed
Coffee shop owners	Medium	Medium	Keep satisfied
Investors / Accelerator	High	High	Manage closely
Developers / Tech team	Medium	High	Keep informed
Moderators / Support	Low	High	Keep informed
Legal / Privacy	High	Low	Keep satisfied
Competitors (Meetup etc)	Low	Low	Monitor

RACI Matrix:

Activity	User	Dev Team	PM	Legal	Coffee Shop
Define requirements	C	C	A/R	I	I
Design UX/UI	C	R	A	I	C
Matching algorithm	I	R	A	I	I
Data privacy compliance	I	C	C	A/R	I

Coffee shop onboarding	I	C	R	I	A/R
User support	C	R	A	I	I
Launch & marketing	I	C	A/R	I	C

3. Backlog

Epics (4):

EP-1: User Onboarding & Profiles

- Users register, create profiles, set interests.

EP-2: Spontaneous Meetup Creation & Matching

- Users create "right now" meetups; algorithm matches them.

EP-3: In-App Chat & Coordination

- Chat before meetup; share location, time, contact.

EP-4: Safety, Ratings & Moderation

- Check-in, rate users, report issues.

User Stories (7) + Acceptance Criteria:

US-1 [EP-1]: User profile setup

As a solo remote worker, I want to set up a profile with my tech interests so that the app can match me with relevant people.

AC:

- Profile fields: name, bio, interests (multi-select tech stack/topics)
- Google and GitHub OAuth login
- User can edit profile anytime
- At least 1 interest required to enable matching

US-2 [EP-2]: Create a spontaneous meetup

As a tech meetup seeker, I want to create a "right now" meetup with a topic and a location radius so that I can find people nearby within 15 minutes.

AC:

- User selects: topic, radius (500m/1km/2km), duration (30/60/90 min)
- Meetup appears in the feed immediately
- Creator sees real-time join count
- Auto-cancels if no one joins within 15 min

US-3 [EP-2]: Match & join meetups

As a user, I want to see a list of active meetups near me so that I can join one.

AC:

- Map view: pins with topic, distance, people count
- List view: sorted by distance or newest
- One tap to join; notification sent to creator
- Max capacity can be set (default 3)

US-4 [EP-3]: In-app chat

As a matched group, I want a temporary chat room so that we can coordinate which exact coffee shop and table to meet at.

AC:

- Auto-created when 2+ people match
- Chat expires 2h after meetup end time

- Share location pin, photos
- No history retained post-expiry

US-5 [EP-4]: Check-in & rating

As a community member, I want to check in at the meetup and rate participants so that the community stays safe and trustworthy.

AC:

- Check-in button active when within 200m of meetup location
- Rate 1-5 stars + optional comment on each participant
- Low-rated users (avg < 3) get flagged for review

US-6 [EP-4]: Report & block

As a user who had a bad experience, I want to report or block someone so that I feel safe using the app.

AC:

- Report reasons: harassment, no-show, inappropriate behavior
- Blocked users cannot match with reporter again
- Moderation team notified on 3+ reports on same user

US-7 [EP-1]: Notifications

As a user, I want push notifications for new matches and messages so that I do not miss a spontaneous meetup.

AC:

- Push notification on match
- Push notification on new chat message (within 10 min silence)
- Sound/vibration settings configurable
- Do not disturb mode between 23:00-08:00

4. Prioritization (MoSCoW)

US	Title	Priority	Rationale
US-1	Profile setup	Must	No matching without profiles
US-2	Create meetup	Must	Core feature
US-3	Join meetups	Must	Core feature
US-4	Chat	Must	Cannot coordinate without it
US-7	Notifications	Must	Users will miss meetups
US-5	Check-in & rating	Should	Safety but v1 minimal
US-6	Report & block	Should	Safety, can extend v1.1

Prioritization reasoning: MVP must deliver the core loop: profile -> create -> join -> chat. Safety features are Should because the app can launch with basic reporting and expand later.

5. Solution Concept

Modules:

1. Auth Module - Google/GitHub OAuth, JWT session.
2. Profile Module - CRUD user bio, interests, preferences.
3. Matching Module - real-time topic + geo + availability matching.
4. Meetup Module - create, join, cancel, expire meetups.
5. Chat Module - ephemeral group chat per meetup (WebSocket).
6. Notifications Module - push via Firebase.
7. Moderation Module - check-in, ratings, reports, blocks.

Tech stack: React Native (mobile), Node.js / Go backend, PostgreSQL + Redis, Firebase Cloud Messaging, Mapbox/Google Maps API.

6. Flowchart (Sequence)

Main happy path sequence:

1. User opens app -> sees map with nearby active meetups
2. OR user taps "Host Now" -> selects topic + radius -> meetup created
3. Other users see new pin on map -> tap to view -> tap "Join"
4. When 2+ people joined -> chat room auto-opens
5. Group coordinates coffee shop via chat
6. Meetup starts -> users check-in via GPS
7. After meetup ends -> rate participants
8. Chat expires after 2h

Diagram note: A visual BPMN can be provided separately. The logical flow is: CREATE -> DISCOVER -> JOIN -> CHAT -> CHECK-IN -> RATE.

7. Mockups (text descriptions of 3 screens)

Screen 1: Main Map View

Header: current location + notification bell + profile avatar.

Body: full-screen map with color-coded pins:

- Blue pin = tech meetup (React, Python, etc.)
- Green pin = language exchange
- Orange pin = board games / casual
- Number on pin = people already joined

Bottom sheet (draggable): list of meetups near you, sorted by distance.

Floating button (bottom right): "+ Host Now" -> opens create flow.

Screen 2: Create Meetup

Header: "New Meetup" + cancel button.

Fields:

- Topic text input (free text, e.g. "React Native side projects")
- Radius selector: 500m / 1km / 2km (pill buttons)
- Duration: 30 min / 60 min / 90 min
- Max participants: 2 / 3 / 5 (stepper)

Tags: quick-select interest tags (AI, DevOps, Gaming, Startup, etc.)

Bottom button: "Post Now" (green, full width).

Screen 3: Active Meetup + Chat

Top bar: meetup topic + timer (remaining time till auto-cancel/end).

Participants row: avatars + names + "checked in" badge (if within 200m).

Chat area: standard messaging UI

- Text input + send button
- Share location pin button

Bottom: "End Meetup" button -> triggers check-in + rating flow.

After end: chat becomes read-only, expires in 2 hours.

8. AI Usage & Critical Reflection

How AI was used:

- Idea generation for user stories and edge cases.
- Grammar and clarity check for vision statement.
- Structuring the backlog in a standard format.

Referenced AI conversation: assistant session within this report.

Prompt used: "Generate user stories and acceptance criteria for a spontaneous meetup app for tech workers."

Where I disagreed / corrected AI:

1. The AI suggested including a calendar/scheduling feature. I removed it because the core product is "right now, not scheduled." This would dilute the instant value proposition.
2. The AI proposed a payment/subscription module for v1. I removed it. Monetization can come later; v1 needs zero friction.
3. The AI under-prioritized moderation. I elevated check-in and rating to Should (from Could) because safety is critical for offline meetups.
4. AI suggested food ordering integration. I pushed it to out-of-scope because it adds complexity without proving the core hypothesis.
